Task 2 – GTM Tracker Dashboard

Objective

To design and document a multi-page dashboard system that visualizes lead funnels, campaign performance, and RCA (Root Cause Analysis) insights for Alcovia's Meta Ads and program campaigns.

Technical Setup

Component	Description
Database Layer	SQL scripts written for PostgreSQL to create and populate tables. These scripts simulate realistic data for testing and analysis.
Visualization Layer	Dashboards built in Power BI Desktop using CSV exports from the PostgreSQL tables as data sources. This approach was chosen due to time constraints and subscription limitations preventing direct database connectivity.
Data Sources	CSV files generated from PostgreSQL queries, imported into Power BI for modeling and visualization.
Pages Developed	1. Revenue 2. Funnel Journey 3. Campaign Performance
Note	Due to time constraints, only the Revenue page was fully generated in Power BI. Other pages are documented with mock-ups and SQL scripts prepared for future implementation.

Data Model Summary

Tables Created:

1. leads

- Purpose: Tracks lead progression through funnel stages.
- Key Columns: lead_id, stage, status, created_date.
- Usage: Powers Funnel Journey visuals (Page 2).

2. campaigns

- Purpose: Master table for campaign metadata.
- Key Columns: campaign_id, campaign_name, start_date, end_date, budget.

- Usage: Provides relationships for campaign-level analysis.

3. campaign_metrics

- Purpose: Stores ad-level performance metrics.
- Key Columns: metric_id, campaign_id, asset_name, impressions, clicks, frequency, spend, date.
- Usage: Powers CTR %, Frequency, and Cost per Lead visuals (Pages 3 & 4).

4. landing_page

- Purpose: Captures landing-page health and conversion behavior.
- Key Columns: page_id, campaign_id, page_name, visits, exits, conversions, load_time.
- Usage: Powers Drop-off Rate, Load Time, and Conversion Rate KPIs (Page 3).

5. revenue

- Purpose: Tracks revenue outcomes from campaigns.
- Key Columns: revenue_id, campaign_id, total_revenue, roi, reporting_date.
- Usage: Powers the **Revenue Page** (the only fully implemented dashboard due to time constraints).

Dashboard Highlights

- **Revenue Page:** Fully implemented in Power BI with CSV data source.
- **Page 2:** Funnel Journey — visualizes lead conversion stages and top metrics.
- **Page 3:** Campaign Performance — compares CTRs, ad frequency, and landing-page health.
- **Page 4:** RCA Analysis — identifies campaigns to drop, refresh, or scale based on KPIs.

Constraints & Workarounds

- Direct PostgreSQL-to-Power BI connection was not used due to **subscription and time limitations**.
- CSV exports were used as interim data sources to ensure dashboard functionality.
- Only the **Revenue page** was fully implemented; other pages are prepared with mock-ups and SQL scripts.
- Some advanced automation (real-time refresh, workflow triggers) was deferred.

Constraints & Workarounds Future Implementation Plan

Once onboarded or when full access is granted:

- Integrate dashboards with **ClickUp** for task tracking and campaign management.
- Automate data flow using **n8n** workflows to sync PostgreSQL data → ClickUp → Power BI.
- Enable scheduled refreshes and dynamic KPI updates for live performance monitoring.
- Complete implementation of Funnel, Campaign Performance, and RCA pages beyond mock-ups.
