In the current scope of Alcovia, we are facing the following problems which we feel can be solved using the right tech integration. These are problems in no specific order, similar to how they will hit you as a business ask in day to day life at Alcovia.

Task at hand :

1. Think of the most efficient way to solve the problem. Assigning tasks, and timelines to 3 resources that will be mapped to you :
    a. Full stack engineer : 1
    b. Process/Systems designer (Commerce field) : 1
    c. YOU.

2. Assuming that you join in from 1st November, how would you timebox the solutioning of the problems at hand, manage the tasks through the team strength, and build systems and structures that dont break.

Current systems being used at alcovia (not to their best of capabilities though) :

1. Clickup- internal data saving tool (all reflections of conversations with parents are stored here) & for messaging each other. This tool also acts as a key component of our sales funnel- as all leads that we get are stored here, qualified here and their nurture journeys are mapped here.
2. N8N- Setting automations.
3. Smallest.ai : Automated AI call scheduling is to ensure that they show up in tourist coverage as super high.

Problem statements at hand :

1. Our current app has reached a stage of being stable, with zero app failures, but adoption is pretty low. The current app usage, on average across all our users, stands at around 2.15 minutes and this, on average, needs to be 30 minutes in a stable state. Our app has the following features:

Test account for the app.

- *Email: nehil.chandrakar@alcovia.life*
- *Password: Test@12345*

For Android users, please check the following APK file link:

https://drive.google.com/file/d/1DFEiwn1j_ntZ34fav6OaadSPL6Tjhvbr/view?usp=sharing

For iOS users, please use the TestFlight link below:

https://testflight.apple.com/join/1CyZ3fdT

App Summary

Students come for Home and the Realm game. Most other features are tried by a few students and then dropped.

- **Small, flat base:** 20 students used the app in the last 45 days, 11–17 of them in any given week. 7 have not opened it in the last two weeks.
- **Strongest features:** Home (every student) and the Realm (13 students, and the most used this week). The Focus Timer was opened by 11 students, but only 5 use it regularly.
- **Weakest features:** wellness (1 student connected WHOOP), and Streak and Rankings (1 student each). Goals had a single completion in 45 days.
- **Study habits fade:** 10 students opened the Syllabus, but only 1 this week. Nobody opened the Study Planner or Academic history this week.

Feature map

This brief covers the student app only. Students get about 25 features in five areas: Home, Study, Plan, Focus & game, and Wellness. Parent, advisor, counselor and admin features are out of scope.

Student

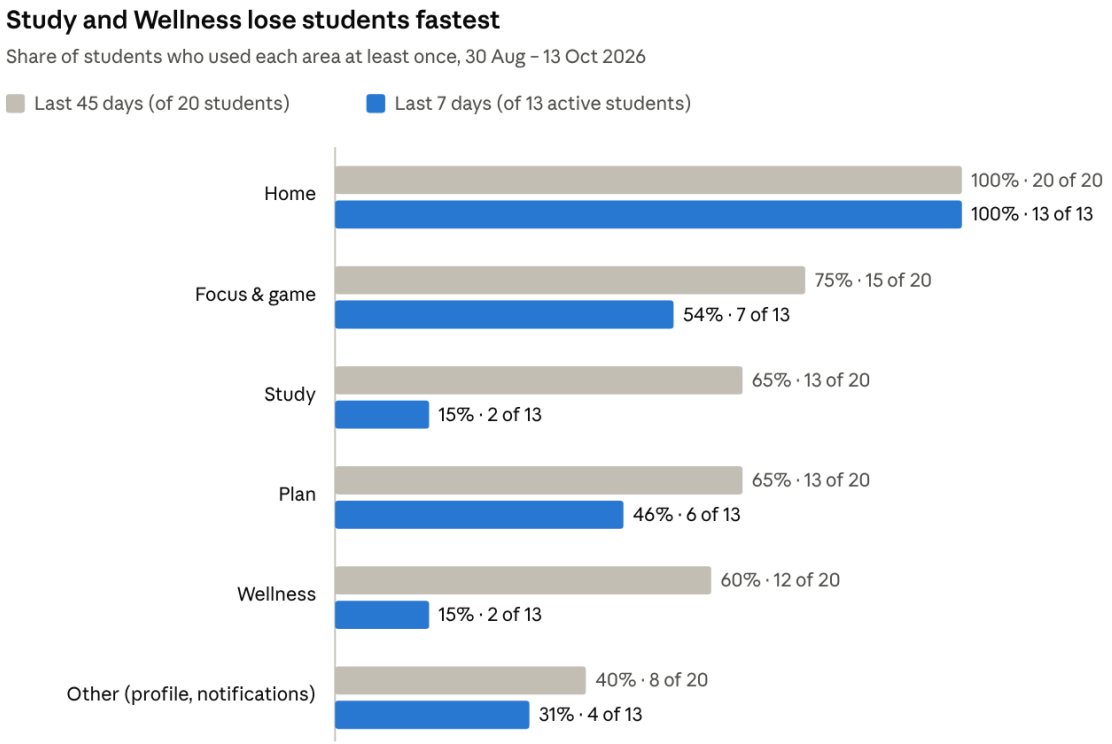

Students move around with three tabs (Home, Study, Tasks) and a Realm button. Profile opens from the avatar on Home.

Area	Features	What the student can do
Home	Home dashboard, daily login reward, Discover / Feature Guide, welcome carousel and guided tour	See a feed of cards (focus score, syllabus pace, attendance, exams, sessions, calendar, wellness, nudges), collect daily coins, browse all features, and take the first-run tour
Study	Syllabus (subjects, chapters), Attendance, Study Planner, Exams, Academic history	Work through chapters (update tasks, run revisions, record scores), check attendance, see the hours budget, track exam countdowns and past records
Plan	Tasks / To-dos, Goals & Roadmap, Mentor sessions, Calendar	Manage own and advisor-assigned tasks, follow quarterly and monthly goals, see and rate mentor sessions, and plan the day in a calendar synced with Google
Focus & game	Focus Timer, The Realm, Dragons, AlcoCoins and Streak, Rankings, Side Quests	Run focus sessions that hatch dragon eggs, conquer territories on a 3D globe, collect dragons and coins,

Area	Features	What the student can do
		keep a daily streak, climb the leaderboard, and do advisor quests
Wellness	Wellness dashboard, wellness extras (Rest Mode, League, feed, badges, trends), WHOOP connect, Insights and screen time	See recovery, sleep and activity from WHOOP, take rest breaks, compete with rivals, and get mood, habit and screen-time insights
Other	Notifications, Profile	Get push alerts that open the right screen; see the journey card and stats, and manage settings, mentors and support

Adoption by feature

Every student uses Home, and three in four tried Focus & game. Study and Wellness drop off hardest: about two-thirds of students tried each in 45 days, but only 2 of the 13 students active this week used either.

2. **Create a solid GTM tracker :** We need strong accountability to ensure our scale up is seamless. Things it should be able to track :
    a. REVENUE :
        i. target v/s achievement for the month

    ii. Split between 3 month trials (one of our constructs) and full program sign up
    iii. Monthly students onboarded
    iv. Workshop revenue (at 3999 per seat- tracked from razorpay) for fortnightly workshop
    v. Program v/s workshop revenue tracking
    vi. Invoice generated but not paid
    vii. Renewals coming up for 3 month trail teens
b. FUNNEL Journey : For meta ads that we run to promote our program
    i. Total leads- Qualified leads- Discovery call set (measure show up rate)- Ambition interview with the teen (measure drop off rate)- Architect session (with parents and teen to show them their personalised roadmap for alcovia)
    ii. Top Metrics- Cost of qualified leads, program conversion %age (those who pay and sign up for the duration we are reviewing the data for), organic lead count, average lead journey in the funnel (before they sign up, or drop off)
c. CAMPAIGN PERFORMANCE : workshop and program campaign performance- assets with highest CTRs and the lowest ones we need to refresh, frequency of ad set (3+ means we need to change), landing pages health (drop off rate, loading time)
d. RCA : Key matrices that will help us figure out which campaigns to drop, which ones to refresh, and which ones to scale money on.

Create a dashboard that shows data as per the timeline selected in the selection box and use a dummy value to showcase the best visual representation of the dashboard that you can come up with.

3. **BEST STRUCTURE TO ENSURE PRODUCT/ SYSTEM DELIVERY :** We have consistently struggled with ensuring that the products and the systems that we make are actually working at their best, have the highest insights and the least cognitive load, and are able to be super functional for either the teens or end users (who can either be parents or teenagers).

   We have not been able to zero in on the best way to put down that structure for that thought: the way each feature will be built and scaled to ensure the highest completion of the success metric attached to that particular task. As a person who will essentially lead two more team members, how will you ensure that every new OKR (which might be a feature release, maybe an analytical upload, or maybe any other new app feature) has the highest success rate? Run me through a very detailed process here, breaking things in such a way that I understand the flow very easily

4. **Creating a student dashboard** : Currently, we weekly discuss the progress made with all kids that we have onboard. But right now, everything needs to be written in a document, or is placed in different folders in clickup. This is quite a pain as we are not able to see progress made on average for all kids.

With our kids, they go through the following rigour :

At a Day level	Description
Timetable management	Post school- timeboxing what they do.
Daily Quizzes	Everyday, we conduct a quiz at 8pm for students to just become aware of general knowledge. Topics vary daily from sports, to history, to logical reasoning, to brand logos etc.
Focus Time Spent	Ideally, we would want to launch an app where we can see the number of minutes Alcovian has spent with her phone running focus time using our app. In this state, no other app opening is possible, just parallel calls are allowed to whitelisted numbers (parents potentially)
Active Minutes	Can our app use the Alcovians wearables data to understand the physical strain that the child has indulged in. Currently, sync that up from apple & samsung watch, Whoop, Garmin
Active Recovery	Can our app also use the above wearables data to understand sleep & recovery patterns for each Alcovian
At a week level	Academic advisor takes the ownership of designing the academic roadmap, and Personal Roadmap. Academic Roadmap is as follows : Academic roadmap is created to help students better their academic performance, but the constraint to this is : Academic advisors are not subject matter experts. Given this construct, what can be the scope of help that they can do for non tuition subjects? Current width of inputs : Goal setting and trend analysis : Comprehensive understanding of subject affinities (preferred/ interesting subjects) and scoring abilities (Dont like the subject, but scores are high) Basis inputs, set score targets for each students for each type of exam, over the coming 1 year. (Formative, UTs, mid terms/ half yearly) Time management : Implement weekly and daily time management tools to understand time utilization. This should come from two inputs- Syllabus completion basis exam syllabus (In case the syllabus is not clear, we can use ratios to set targets- 1 year- 4 quarters, every quarter- 25% of syllabus should be covered with the ideal Rigour we want) Accommodation of current extra curricular activities into the

Academic Session 1	weekly timetable. We can potentially also use AI logics to guide timetable building (Suggestions of key chapters that the teen needs to study basis on syllabus completion %age) Extra curricular activities Tutions Free time We need to then find time slots where the teen can indulge in self study. In these durations (ideally everyday- benchmark for syllabus completion should stem from the rigour that we have made below) Once a month, an Academic advisor should spend time reevaluating how the syllabus completion is going on. This ensures a templatised way of syllabus completion for all students.
Academic Session 2	Metrics for success : Task Completion rate, Deadline adherence, Time estimation accuracy, Syllabus completion : Below is the rigour thought of when it comes to someone saying that they have completed a particular topic/ chapter Subject wise chapter reading Making notes/ any other recollection forward strategy that works for the teen Practising questions at the end of the chapter/ worksheets given by school (accuracy of above 70%) Past question paper attempt within time constraints Readiness when exam accuracy hits above 80% Metrics for success : Chapter readiness score (basis stage of chapter completion rigour). Adherence to the above process at a month level. 4. Input metrics for the academic advisor : Alignment on academic targets with students and parents : detailing out logics used to set subject level scoring benchmarks. Preparation guardrails for all subjects basis the rigour that we have set in terms of : Month level chapter completion at a subject level. Alignment on rigour of chapter completion at a quarter level. Ensuring that alcovians fill in inputs at a certain cadence to ensure that automations are accurate. Feeding the input to the automations to ensure that all stakeholders are sent a message in case of deadlines being missed. Setting pre-determined inputs of tutors/ academy support in

	case performance has a deviation of X% Monthly consolidating missed timelines to make the Alcovian do Sprints- to ensure the rigor per subject is met.
At a Month level	
Workshop 1	Workshops are created to enable Career discovery- we get a new professional to come in every time and in 30 minutes, highlight their journey, how a day in their life looks like, what is the scope of the Industry etc. this is followed by a real life simulation for all Teens to then, in groups that we create, solve for real life problem statements of that profession in a time crunch, ever changing story line. So, in a fun way, they understand what that career is all about. In this duration, we also track their engagement, team work, crisis management, adaptability, public speaking and 11 such soft skills.
Workshop 2	
Pod Session	(5 Alcovians meeting for 2 hours to discuss on topics from 4 themes- Dreams, Aspirations, Fear & Vulnerabilities). Idea is that we want this to act as the peer group for alcovians to help each other.
Peer Session	(Academic Advisor sets meetings between Alcovians for them to learn from each other)
Mentor call	(once a month, a call with a professional that ALcovian is curious about)
Personal branding	(Shoots done for Alcovians where the edited clips go one their respective Socials (instagram is managed by Alcovia, LinkedIn by Alcovians themselves)
Quarter Level	
Podcast Shoot	Alcovians, for the careers they are curious about, get to meet an industry veteran/ public personality and host the professional and ask questions pertaining to their lives, and how teens like alcovian, can 1. understand the career. 2. Become them in the time to come
Competition Prep	We prepare a teen for a competition every quarter- either enable help from another alcovian, or help ourselves (non sports, non technical competitions)
Parent child Bonding	1 workshop every quarter mandates parents to also come and participate in a fun workshop to ensure that child and the parents bold well
Out of City experience	Every quarter, one workshop if conducted outside of the city - creates memorable memories for the alcovians
Themes for Quarter	
Social Work	for three months- alcovians do social work in groups. to cultivate empathy.
Entrepreneurship	For three months, alcovians individually build a startup to

	cultivate grit and resilience
Summer Program Closure	Application process for elite summer school programs
Roadmap	
Career	career related roadmap made for the alcovian. Binary outcome- either done or not done
Personal	Personal roadmap is to help the alcovian in a long term pursuit, broken down into monthly milestones
Academic	Described above
Syllabus completion	If syllabus completion is on track
Rigour of completion	If the alcovian is going through complete rigour for syllabus completion

Problem statement : Create KPIs for measuring the above from the lens of :

1. Did alcovia conduct it (quantity)
2. Did Alcovians like it (Quality)
3. How was the alcovians performance (Student performance)

How will you design the dashboard? In what time? Where will it be reflecting and how will it record data with minimal human intervention.

You have time till 72 hours to close on the input and submit them.

This assignment has been designed to understand how you think, so, use AI as an enabler, but not as the source for ideas. Not that tough to figure out which solution is which.
